

28/9/26

Day 4

Excel - Transpose & Paste Link

1. Transpose (vertical to horizontal)

Transpose changes data from vertical (column) format to horizontal (row) format.

Steps:

Select data → Copy → Right-click → Paste special → Transpose

Example: vertical: A, B, C ↓
horizontal: A|B|C →

2. Paste Link

Paste link copies data while keeping a connection to the original cells.

- If the original data changes, the linked data also updates automatically.
- Steps: Copy data → right-click → Paste Special → Paste link

Excel - Paste Special operations

1. Add column A + column B

- Select column A data and copy it.
- Select column B $\rightarrow$ Paste Special $\rightarrow$ Add
- The result is added directly to column B.

2. Subtract, multiply and divide

- First generate random numbers using:
 $=\text{RANDBETWEEN}(1, 100)$
- To keep the random values fixed:
Copy $\rightarrow$ Paste Special $\rightarrow$ values
- Then use Paste Special to Perform:
 - subtract
 - multiply
 - divide

3. multiply column data by 4

- formula : $=A2 * 4$
- This multiplies the value in A2 by 4
- F4 is used to lock a cell reference when need
 $=A2 * \$H\1

4 convert To negative value

$$= H2 * -1 / 64 * -1$$

$$= -64$$

5 convert To positive value

$$= -64 * -1$$

$$= 64$$

Excel $\rightarrow$ references

1. Total using Relative References

- To find the total of sub1, sub2, & sub3:

$$= \text{sub1} + \text{sub2} + \text{sub3}$$
- This is a Relative Reference because the cell references change when the formula is copied

ex :- $64 + 59 + 80 = 206$

2 Absolute Reference - Tax Amount

- used the salary column to calculate tax.
- Formula

$$= \text{Salary} * \$1\$9$$
- here, F4 contains the tax rate (e.g., 8%)
- Press F4 to make the cell reference absolute

$$: \$F\$4$$
- The reference remains fixed when the formula is copied to other cells.
